But rather than returning the values of these or. 9(ii)â€ Automated data storage libraries are known for providing cost effective storage and retrieval of large quantities of data. The data in automated data storage libraries is stored on data storage media that can be, in one example, magnetic tape cartridges. Media library systems are located in housings, and those housings can be mounted in a chassis. The chassis is designed to accommodate any of a number of different library arrangements. For example, the library housing may be directly attached to a shelf assembly in the chassis or alternatively the library housing may be mounted on a separate shelf assembly that is attached to the chassis. A transducer, or head, is mounted to a pivotable actuator arm that can be used to position the transducer over selected data tracks on the magnetic media. The transducer is used to write and read information from the data storage media. In the direct attachment library system, the pivotable actuator arm is connected directly to the shelf assembly. In a separate shelf assembly library, the actuator arm is connected to the shelf assembly via a link mechanism. The actuator arms and shelf assemblies
