The program, called Omega, was first introduced by Susanna Oeser and myself. Our earlier software relied on generating consensus sequences, and proved to be time-consuming and error-prone for the very long sequences required to assemble novel species. We have developed a simple and fast algorithm that generates single consensus sequences without any multiple alignment by using the information on the read error rate and read pairs. This results in a dramatic increase in the speed and robustness of the program. The algorithm has been implemented in C++ for parallel execution using the SIMD instruction set of Intel x86 processors. Omega is sufficiently fast to be used for in-depth genome analysis of even very large genomes. The software is available from The first version of Omega is available in a public sourceforge.net repository: Documentation and the latest version are also available from The current version allows assembling individual chromosomes, where Omega also makes use of the results of other programs (e.g. PHRAP for recombination). We are also currently developing a new program, OASES (for Omega Assembly of Sequence Ends), which constructs the insert sequence into a circular chromosome.Nancy Reagan, Geraldine Ferraro, and the eight years of madness In 1979, after the Democrats nominated a sitting governor for president, the Republican Party nominated a 68-year-old Georgia congressman. It must have felt like the perfect time for something horrible to happen. And it did. Someone from the Reagan camp leaked a tape of Nancy Reagan planning a late-night "mock assassination." The public picked up 6d1f23a050
